Unlike its previous versions, Adobe Photoshop Elements continues to be quite robust. You can adjust everything from basic white balance, exposure, saturation, contrast and a variety of other settings. But it would help if this program worked better when it comes to color adjustments. A white balance adjustment does nothing to get rid of white in a color image, nor does it do anything to get rid of blue if the blues in multi-color images are too strong. If you subtract a blue color from a red, green or yellow color, you get an orange; but Photoshop Elements does not compensate either for the blue that's subtracted. And if you overdo the blues, your photo will be, well, murky. The Levels tool really helps here, not only by allowing you to make minor adjustments in order to move colors around, but also compensating for color mismatches with the general look of the image. Sure, Lightroom feels a little sterile, but it's still a program that offers the best, most powerful functions. It seems silly to ask for something that already exists, but we have long been waiting for Adobe to get Lightroom to the point where it becomes a little more like Aperture, because that's the real match for Lightroom. Like Aperture, Lightroom is a free download. Like Lightroom, Aperture has a very good integration with Adobe Camera Raw, and with Match and Mini Bridge. Like Lightroom, Aperture 3 is poorly optimized for Intel-based Macs due to some unintegrated or partly integrated code, which should have been fixed.
