Beyond all the obstacles that stand between you and that tool, there's no reason that you can't create stellar work on modern hardware. You don't need to be one of the greatest photographers on the planet to use these tools. The truth is, I've not seen a more powerful way to control pixels than Photoshop. While the skills we take for granted like blending and sharpening are present, the rest of what we do is exposed to you as you navigate the workflow. You can create effects such as sepia and grayscale easily, and you can layer multiple images to create a complex effect. That's where things begin to improve on the iPad, with the new curves layers that allow you to create more sophisticated curves blends without needing the touch of a more experienced user. But it's not just that, either. Elements 2019 comes with a more intuitive version of the performance preset modes. (See the list of my nominations.)

With every new release, much of the software has a seamless interface. Having access to a design, the touch of a button and the resulting changes are so satisfying that even when the tool doesn't look like it has been performing at the level of the competition, I still find myself using it. **ABOVE:** *The existing interface and functions of Photoshop can drive you insane. I recommend the UI overhaul in Elements 2019. That's shown in the picture below.*

**BELOW:** The new Autofill in the iOS app can mimic the Layers panel in the desktop software. The switch from shades of gray to underlying colors allows you to see the single layer as opposed to a multi-layer composition.

If you don't already have Adobe Products or Adobe Creative Cloud, you can now purchase the standalone software at a very reasonable price. You can find the Adobe software on our website: [www.designusa.com/shop](http://www.designusa.com/shop) This is the first of two videos as part of our Adobe Photoshop Series. For the second video, we will go over the Design Suite which is bundled together with the Photoshop software in the Creative Cloud. To learn more about the Design Suite, click the link here <http://www.designusa.com/help/areas-of-focus/design-suite> In this first video we will cover the basics of Photoshop. One of the things that sparked my interest was the 50.50 max magnification. This seemed like a great tool at the time for seeing details that make up an image. Unfortunately it hasn't lived up to it's name. For example when used with the Brush tool, it would take more than 700 pixel brush strokes before I could see any change in the photo. The 50. The idea of running software as complex as Photoshop directly in the browser would have been hard to imagine just a few years ago. However, by using various new web technologies, Adobe has now brought a public beta of Photoshop to the web. (If you prefer watching over reading, this article is also available as a video.) **What It Does:** The Color and Swatches tool lets you use, modify, copy, and save custom colors for your content. While this may seem like a pretty self-explanatory element, it actually has powerful features that will keep your visual content vibrant and unify your color schemes. 933d7f57e6

We've also made it easier to remove unwanted cutouts. Simply select the area you want to expand and click Expand Recessed Areas. Perfect for logos or pictures with adverts in the middle of an image. Anyone using Photoshop CC 2015 may be starting images or reworking parts of an image in Photoshop. Now with the new Specular Highlights feature you can show more detail than ever before. With Specular Highlights, your image will be more appreciative of fine details. To give you a glimpse at what's possible with the APIs available through Mark II and other features—and having those natively implemented in the OS so that Photoshop can see their environment, can leverage as much, or as little, as it requires—I want to share more of my own experiences. You'll see some examples of clips with original HDRI lighting and some examples of new scripted filters. For this round of experiments, I asked fellow filmmaker and colleague Jason Miller ( @evoc108 ) to extend some of his experiments with the new APIs and compare with what he'd accomplish with Photoshop. We've been working together for three years now, and Jason has taught me a lot about Photoshop. He's responsible for creating effects that range from the beautiful to the bizarre to the downright creepy. He really knows his way around Photoshop as a professional colorist and visual effects artist who is very comfortable working with the tools that stand between him and his final edit. Jason works with a variety of broadcast and film partners, and a number of times a year he'll step into another medium for a range of assignments. While working detailed composites, he reads through a script to check ambient light, and then refers to an image of the set shot with an HDRI light box to straighten out the greens and reds because creating complementary and contrasty color will always be very important in television. Jason also often accompanies me on location while he shoots still photographs, and that experience affords us a unique collaborative opportunity to push the envelope of what a single frame of light can achieve. We'll start with a video shot on set with an HDRI. My role is to work on the lighting and sets, and we'll start with Jason's HDRI lighting. The beauty in this approach is that I will effectively be working in the very HDRI-oriented environment he created, and can even pull in assets through context in the same order as we work. The power of modern APIs for visual effects is obvious in the HDRI composites we can now execute.
