Planning the selected task involves deciding what steps to take, how to perform each step, and when to go back and review progress. The selection of steps and their order depend on the complexity of the task, and the complexity of the task is likely to increase as the image becomes larger. In most cases, the image will be the size of a canvas and there won't be a lot of room for maneuver once it's ready to be completed. Completing a task is a combination of the time spent on the selected step and the time spent on the next step. New features available in Adobe Photoshop 2023 make it easier to complete complex tasks more efficiently. For example, new selection tools narrow down the selection process by looking at the edges of objects and grouping them. The AI feature introduced in the 2014 release of the software used by autoprofessionals to automatically correct their images is one of the most exciting new features of Photoshop. With it, a photographer can select a face from a group of faces and the software will identify the person's eyes, nose, and mouth, and then adjust facial features to make a perfect photograph. AI feature offers a high-end photo editing experience to the casual user. Since I remember the AI feature was first seen in the Photoshop CS3 version. I

never had the time to experiment this feature since I have upgraded to the recent version. But I'm so happy to see it in the version CS6. Apart from the face retouching, the AI tool can also adjust the skin tone, remove blemishes and changes the contrast of the image. Additionally, the AI feature also detect the background of the image and automatically adjusts the new image to look good. That's really the greatness of AI, it can generate very good photos within a single photo editor. I'm waiting for the further improvement of AI and the application.
