It is quite important that creating your own JPEG file be a relatively quick process. While I appreciate that saving an image as a different file type may be more desirable for one reason or another, I found myself frequently dragging files into Photoshop to deal with them. The way you can do this in Photoshop is to select all the layers and then use the CMD+SHIFT+DEL to remove them and redisplay all your layers in one window. Of course, saving a PSD file in Photoshop is also not as simple as a JPEG. Not only does it require quite a bit of functionality and technical knowledge, but also the file format requires a high level of understanding. It is worth noting that the file is not actually saved as a Photoshop format photo, but as a PSD-compatible format. You can then open this file inside Photoshop a lot easier (and faster), but you can not open a PSD file directly in your favorite photo editor. Photoshop, when converting a PSD to Photoshop, tries to convert the image into layers. In this case, you get controls such as Layers, Fill, Auto-Align, Auto-Blend, Skew, Distort, and Warp. You can also manually align content. Some of these steps are done automatically, but you can move content using the Edit > Paths > Move Content, and you can use the Move tool to move content around. Some of the image companies offer this as part of their editing tools, so it's nothing new. Still, these tools are understandably hidden in the more advanced options. Do you prefer Photoshop on your Mac or laptop with your scanner and high-speed Internet connection? If you're content with Adobe's cross-platform tools, you may not need or want to try the full Photoshop experience on an iPad or iPhone. Still, if you'd like to run Photoshop on your mobile device, there are a few things you can do.
